

FAULT FINDING

	Fault		Possible Cause		Remedy	
1.	Combustion air fan does not start	a)	No air pressure in duct (positive or negative)	a)	Switch on main duct fan	
		b)	Combustion air switch set too low	b)	Reset switch	
		c)	Duct air switch set too high	c)	Reset Switch	
		d)	If low gas pressure switch fitted, gas pressure too low or switch set too high	d)	Adjust gas pressure or reset switch	
		e)	If high gas pressure switch fitted, gas pressure too high or switch set too low	e)	Decrease gas pressure or reset switch	
2.	Combustion air fan starts, but burner goes to Lockout	a)	Combustion air switch set too high	a)	Reset switch	
		b)	Incorrect fan rotation	b)	Correct	
		c)	Fan blades dirty	c)	Clean fan	
3.	No spark. Burner goes to lockout.	a)	High tension lead not properly tightened at terminations	a)	Tighten lead ends	
		b)	Spark plugs not properly adjusted	b)	Adjust as necessary	
		c)	Transformer failed	c)	Change transformer	
4.	Pilot does not light	a)	No gas	a)	Find cause and rectify	
		b)	Too much gas	b)	Adjust gas pilot cock	
		c)	Pilot valve not opened	c)	Change valve or find open circuit	
5.	Pilot lights but burner goes to 'lockout'	Flar	me not detected because:			
		a)	UV cell not looking at flame	a)	Re-align cell	
		b)	UV cell faulty	b)	Check output. Change cell	
		c)	Flame probe not in flame	c)	Rectify	
		d)	Bad earth	d)	Check output of probe. Make good earth connection	

FAULT FINDING (cont...)

Fault		Possible Cause	Remedy	
6.	Pilot alight, no main flame, burner goes to lockout	a) Main valves not opening	a) Check main valves	
7.	Main flame goes out after lighting	 a) Low gas pressure switch (if fitted) set too high b) High gas pressure switch (if fitted) set too low c) Pilot too high d) Flame not detected 	 a) Reset pressure switch b) Reset pressure switch c) Re-adjust pilot d) Adjust flame detector to see main flame 	
8.	Main flame goes out on reaching high fire	See "Main flame goes out after lighting"	See "Main flame goes out after lighting"	
9.	Flame goes out. No lockout.	a) High or low gas pressure switch (if fitted) faulty b) Duct pressure switch faulty c) Loss of duct air pressure d) Interlock operated	a) Rectify switch b) Rectify switch. c) Check main duct fan d) Re-make interlock	
10.	Flame goes out. Burner goes to lockout.	a) Loss of gas b) Loss of combustion air c) Failure of flame detector	a) Turn off gas and investigate b) Check combustion air fan c) Change detector	
11.	Burner goes to lockout when it is turned off	a) Main gas valves not shutting completely	a) Check main valves at once. Turn gas off at ball valves.	
12.	Heat output not maintained	a) Gas pressure failing b) Burner faces need cleaning	a) Investigate b) Clean burner (see under 'Maintenance')
